What's New in the Ruby For Windows 8?

Ruby is a mature and widely used object-oriented programming language. It has been designed for practical programming and is very straightforward to use. Ruby includes automatic memory management. Ruby is easy to learn. It is very similar to Perl, JavaScript, Smalltalk and C#. In Ruby, modules are classes that encapsulate collections of reusable code. Ruby provides, through its open standard and platform-independent nature, the option of adding more scripting languages to extend its functionality. In Ruby, the literal means the letter, number, dollar sign, underscore, and other similar characters. For example, in Ruby, `$_` is the value of the last item of a list that is stored in an array. Ruby allows the use of octal or hexadecimal numbers to represent a number between 0 and 255. Hexadecimal is the typical number format in computing, but binary numbers are also used with the numeral prefix 0x. Ruby provides a list of available exception classes. They are a typeless collection of system errors. In Ruby, exceptions are raised when an error is encountered. Ruby automatically converts data into the form in which you want it. The standard array is a list of items that can be accessed by index. The Ruby Array class provides many methods that perform various operations on an array. One of these methods is `index()`. The `index()` method returns an integer that designates the position of the last element of an array as the first argument. Ruby includes the Date class. The methods in the class can be used to manipulate dates and times. Rich Text Edit, also known as is an easy-to-use text editor, which is included in the Microsoft Office suite. This is an edit control that allows you to edit text and make changes to them without using the Rich Text (RTF) Format. Any character that can be in Unicode can be in the Rich Text Format. Besides, there are more than 2000 RTF type fonts. The RTF file format does not contain formatting information. Thus, if you wish to insert a new font, do not use the RTF font format. The input method of the Rich Text Format is very simple. You can simply insert text by using the cursor keys. So, you may want to use

the rich text format if you want to insert the special fonts in your document, such as the special character fonts or copyright fonts
